Inventory Center

If monitoring your windows platforms assets is important You need Inventory Center to help you keep it that way

Inventory Center is network management and monitoring software that use WMI protocol to collect information from windows platforms and notifies about changes that may affect the performance and operation of critical network computers and servers.

The software can be operated at any windows environment including local and remote networks without special considerations. The powerful monitoring engine of the software can support any number of platforms.
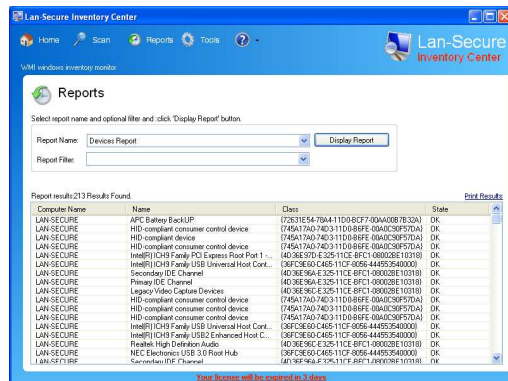

Real-time monitoring

Inventory Center software is collecting real-time attributes from windows operating systems including computer properties, windows properties, devices, programs, services, updates and ports. The collected attributes can be viewed in real-time and perform optional actions and reports about changes and incontinent properties. The software can also perform real-time commands on selected platform properties.

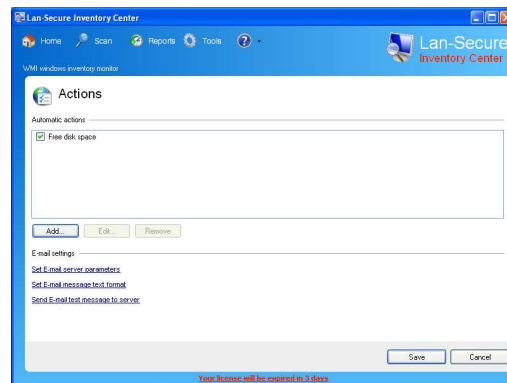

Real-time reporting

Inventory Center provides real-time reporting about windows operating system properties. The software reports include selectable operating system properties and optional filters with exporting capabilities.

Real-time actions

Inventory Center provides optional automatic actions that will be performed upon receiving specific operating system attribute. The selectable automatic actions include selectable conditions for specific operating system and specific property values and selectable alerts like E-mail, commands execution and windows event logs.

Inventory Center Key Features

- Real-time windows operating systems monitoring with optional commands on selected platforms.

- Real-time collection of operating systems attributes including computer properties, windows properties, devices, programs, services, updates and ports.

- Real-time windows operating systems reporting including optional filters and exporting capabilities.

- Real-time windows operating systems actions including E-mail, command execution and windows event logs.

- Support any number of windows platforms including automatic scanning of specific domains or workgroups.

- Optional SQL database and text file exporting capabilities.

Inventory Center System requirements

- A 800 MHz or faster processor with at least 256 MB of RAM

- Microsoft Windows XP, Windows 7/Vista™ or 2003/2008 Server

- At least 10 MB of available free space on your hard disk
