

If your network devices are your most important asset You need Configuration Center to help you keep it that way

Configuration Center is network configuration management software that allows controlling and maintaining configuration changes of network devices from any vendor supporting Telnet SSH and SNMPv1/2/3 protocols.

The software provides configuration backups, history changes monitoring, changes comparison and configurations restore of any network device. It overcomes the need of using several vendor specific configuration tools in multi vendor devices environment and helps to control and reduce configuration errors in IT environments.

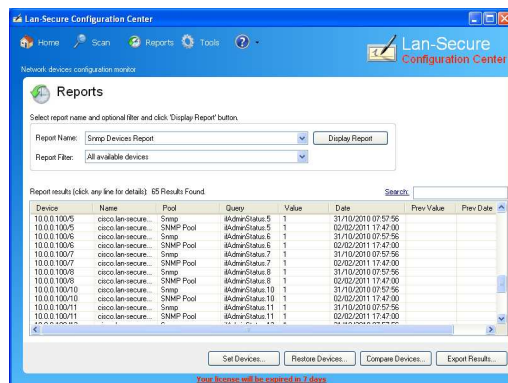

Real-time configuration monitoring

Configuration Center software can monitor any number of devices from any network location. The software monitoring engine can be operated manually by user request or run automatically on specific dates and times.

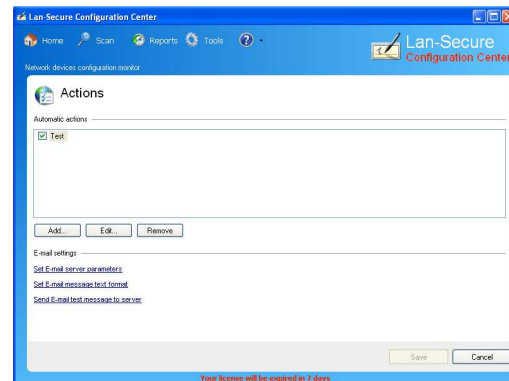

Real-time configuration control

Configuration Center provides unique control tools that include settings of specific configuration to specific selected devices, restoring configuration to specific network devices, comparing devices configuration and enhanced configuration logging, reports and exporting capabilities.

Real-time configuration actions

Configuration Center provides optional automatic actions that will be performed upon receiving of specific configuration settings from selected devices. The selectable automatic actions include E-mail, SNMP traps and commands execution.

Configuration Center Key Features

- Real-time network configuration management of network devices from any vendor.
- Real-time configuration management control including backup, restore, compare and changes settings.
- Real-time user selected logging and reports including shell and SNMP devices configurations.
- Support any network devices using shell protocols like Telnet and SSH and SNMPv1/2/3 protocols.
- Optional automatic configuration actions like E-mail, SNMP traps and command execution.
- Optional SQL database and text file exporting capabilities.
- Optional automatic configuration scanning on specific dates and times.

Configuration Center System requirements

- A 800 MHz or faster processor with at least 256 MB of RAM
- Microsoft Windows XP, Windows 7/Vista™ or 2003/2008 Server
- At least 10 MB of available free space on your hard disk
